

## CMP1903M Object Oriented Programming A02 2024-2025

Learning Outcome	Criterion	Pass	2:2	2:1	1
[LO2] Identify the values of object-oriented design and programming	<p>Illustrate OO features which were used (20%)</p> <p>[Video, Report]</p>	<p>Simple description of the code; fail to mention some OO features which are used in the code.</p> <p>There is some discussion, though, of OO features such as object instantiations and method calls for example.</p>	<p>Clear evidence of the OO features in the code.</p> <p>Inheritance is referred to and shown where it is evident in the code.</p>	<p>Thorough description of the OO features in the code; Inheritance is described in the video and report and examples shown in the code.</p>	<p>Extensive description of the OO features in the code; Inheritance and polymorphism are described and exemplary examples shown in the code and referred to in the report.</p> <p>An explanation of why they benefit your code is also made. Examples of static OR dynamic polymorphism may be present</p>
[LO3] Apply object-oriented principles to the implementation of software programs	<p>Develop an object-oriented solution to a problem (60%)</p> <p>[Code, Video, Report]</p>	<p>A limited implementation is presented.</p> <p>The application works, however, its functionality is incomplete.</p> <p>For example, the specific requirements (as described in the brief document) are not implemented correctly.</p> <p>Erroneous input is handled but the errors are not handled completely and/or all possible errors are not handled.</p> <p>Some evidence of object-oriented features such as classes, object instantiation and methods/method calls are present, but they may not be implemented well.</p> <p>The checklist and video are</p>	<p>An implementation is presented which works.</p> <p>The player can select from a menu and view statistics.</p> <p>The functionality allows to navigate through multiple rooms or to battle monsters with varying difficulty or to manage an inventory with multiple items.</p> <p>Erroneous input is handled either by error or exception handling methods. All errors may not be addressed.</p> <p>Clear evidence of object-oriented features such as classes, object instantiation, encapsulation and methods/method calls are present. C# features such as class constructors are present.</p>	<p>An implementation is presented which works.</p> <p>The player can select from a menu, and additionally can perform tests</p> <p>The functionality allows at least two of the following: 1) navigate through multiple rooms 2) battle monsters with varying difficulty 3) manage an inventory with multiple items.</p> <p>Erroneous input is handled by error and exception handling methods. i.e. the game does not crash with erroneous input.</p> <p>Thorough evidence of object-oriented features such as classes, object instantiation, encapsulation and methods are present. Inheritance use is evident. Clear use of public/private access modifiers. C# features such as collections (Lists&lt;&gt;, etc) are used.</p>	<p>An implementation is presented which is complete.</p> <p>The functionality allows all of the following: 1) navigate through multiple rooms 2) battle monsters with varying difficulty 3) manage an inventory with multiple items.</p> <p>Erroneous input is handled either by error and exception handling. All possible errors are handled.</p> <p>Evidence of additional OO/C# features such as (but not limited to) LINQ, interfaces, virtual/abstract methods are implemented.</p> <p>Protected access control is used.</p> <p>Static(method overloading) and/or Dynamic(method overriding) polymorphism is present</p>

		completed.	The checklist and video are completed.	The checklist and video are completed.	The checklist and video are completed.
[LO4] Use testing principles in the testing and debugging of object-oriented applications	Testing practices used to verify/validate a software application (20%)  [Code, Video, Report]	A Testing class is used to verify aspects of the game operation. This verification may not be correct though and may not be useful.	A Testing class is used to instantiate a Game object and verify methods are operating correctly.	A testing class is used to instantiate a Game object and verify methods are operating correctly using debug.assert()/trace.assert() methods	A Testing class is used and individual methods are tested. A robust reporting mechanism is used to document the test outcomes (a test log file for example).
Weighting is 70% of the module
